DATA STRUCTURE AND PROGRAM DESIGN LAB – 10

10. Write a C program (name it "filecopy. c") that copies the contents of one file to a destination file. This program will read data from one file and copy them to another. The first input that the program will need is the names of the two files: input file ("input.txt") and output file ("output.txt"). Once the two file names have been obtained, the program must open the input file and create and open the output file.

Case 1: If file not exist

```
Enter source file name: input.txt
Enter destination file name: output.txt
Cannot open source file.
```

Case 2: If file exist

```
Enter source file name: input.txt
Enter destination file name: output.txt
File copied successfully.
```
